- No masonry work
- One day installation
- Reduced consumption

# CASE HISTORY

## Church of Madonna dell'Orto - Venice

The Church of the Madonna dell'Orto is one of the most shining examples of Venetian Gothic architecture.

The structure, dating back to the 14th century, struggled to find a quick and effective solution for heating.

Each problem was solved in one day with the installation of the Warmset system.

The Warmset underfloor heating system can be laid without any masonry work.

With the Warmset system it is possible to cover all the desired surface, guaranteeing the faithful a feeling of warm well-being.

In this case, it was decided to heat the area of the benches and to cover it with an ornamental carpet. However, it is possible to use other materials such as, for example, a wooden platform.

This heating system is completely invisible and silent and in no way disturbs the sight and hearing.

The installation of the Warmset system is quick and cheap. Its consumption is also extremely low, because it quickly reaches the desired temperature.

The end result is an indisputable combination of comfort and aesthetics, which respects the sacredness of each place with respect.
